

WORKFORCE

Office Attendance & People Operations

CEO briefing: how the system works, what it solves,
and the foundation for long-term growth

Simple to understand · Strong operational foundation

What this project is

One clear purpose

Workforce proves people are at the office when they should be, helps managers see who is present, late, or missing checkout, and connects the same company people into chat, daily tasks, and performance — without spreadsheets and guesswork.

Main problems we solve

Why the business needs this

- No reliable proof that staff are physically at the office
- Managers waste time asking who is in, late, or forgot to leave
- Leave, holidays, and attendance conflict or live in separate tools
- Task work and performance sit outside the same people record
- Lobby boards and reports require manual updates
- Growing companies need one system of truth per office and company

Four surfaces — one system

Each role gets the right tool

- Workforce Control (admin): configure offices, schedules, staff, leave, reports, performance
- Work-Force app (employee): geo check-in/out, leave, chat, evaluations
- Office Display: lobby tablets show who is present and meeting rooms
- Task Operations: same company people run projects and boards

Office setup — the foundation

Correct setup once → every day works automatically

- Create company → add offices on a map with allowed GPS radius
- Define work schedules (check-in / check-out times per weekday)
- Add departments and employees; each person linked to one office + schedule
- Set company rules: photo required, auto-checkout, desktop location options
- Assign office admins; invite staff into the right office with the right rules
- Key idea: Office + Schedule = the rules of attendance. Everything else builds on this.

Daily check-in / check-out

How attendance actually works

- 1 Preview location → 2 Check in inside geofence (photo if required) → 3 Work day with reminders
- 4 Check out with worked time and optional worksheet → 5 Auto / missing-checkout jobs close open days
- Enforced: geofence, leave/holiday block, server time, late reason, clean re-entry rules
- Managers get: presence, late/early/overtime, missing checkout alerts, realtime admin + display

Chat — operational messaging

Same company people, right scope

- Direct, group, and admin ↔ employee channels
- Scoped by company; office admins see their office colleagues
- Messaging beside attendance — not a timesheet chatbot
- One identity shared with attendance, tasks, and performance

Task Operations

How daily work runs on the same people list

- Projects, Kanban-style boards, schedules, and assignments
- Staff synced from Workforce employees — no second people database
- Opened from admin or employee app; own permission levels for task work
- Attendance proves presence; tasks prove output — together they tell the full story

Performance

Fairness with evidence

- Evaluation cycles with templates, scores, and goals
- System can score reliability from attendance facts (lates, missing checkouts, worksheets, leave)
- Connects dependability to formal review — not gut feel only
- Same org people record keeps performance linked to the real employee

End-to-end workflow

From setup to long-term value

- Admin sets office + schedule + staff
- Employee checks in / out each day
- Leave & holidays protect the calendar
- Chat keeps the office talking
- Task Operations runs the work
- Performance reviews use real signals
- Display board shows who's in; reports & corrections keep trust

Assumptions we build on

Honest foundations for leadership

- Multi-company (multi-tenant): each organization is isolated
- Physical presence matters — GPS geofence is the proof
- One primary office + work schedule per employee (default model)
- Leave and holidays block check-in (no double counting)
- Ethiopia-first defaults (timezone, holidays, bilingual UX) — expandable
- Tasks are operational; they do not replace attendance proof
- Clear roles: Platform → Company Admin → Office Admin → Employee

Long-term direction

Not complex today — designed to grow without rebuild

- Foundation: one backend, permission codes, office scope, feature flags, realtime, audit, Task Operations
- Horizon: more tenants/offices, deeper analytics, richer performance, stronger display/meeting ops, more policy automation
- Modules can grow without inventing a second identity system

CEO takeaway

Easy to explain. Hard to fake. Ready to scale.

- Workforce is the system of truth for office presence and people operations
- Setup is simple: map the office, set hours, assign people — then the day runs
- Check-in/out + leave + chat + tasks + performance share one company identity
- Problem solved: less guesswork, less spreadsheet ops, more trustworthy records
- Foundation is strong: clear roles, geofence proof, automation safety nets, room to grow
